The background of the slide is a fluorescence microscopy image of several Leishmania parasites. The parasites are elongated, spindle-shaped organisms with long flagella. They exhibit a green fluorescence along their length and a red fluorescence at their anterior ends, likely representing different cellular components or organelles. The overall appearance is that of a multi-colored, wavy pattern against a black background.

**A rationale approach for drug targeting
with special reference
to *Leishmania* cytosolic SIR2**

Supported by the Indo-French Cooperation [Indo-French Centre for the promotion of advanced research (IFCPAR/CEFIPRA)], INSERM, IRD, the Portuguese FCT and the Treaty of Windsor Anglo-Portuguese Joint Research Programme for funding.

SIR2 enzymatic properties

NAD⁺-dependent deacetylase

Adapted from North BJ, 2004

ADP-ribosyltransferase

Adapted from Kowiesky TM, 2008

Overexpression of *LmSIR2* gene and parasite phenotypic characterization

- pTEX plasmid: regulatory 5' and 3'UTR of *T. cruzi* glyceraldehyde phosphate dehydrogenis encoding gene (*GAPDH*) carrying *LmSIR2* gene

Parasites + mAb anti-*LmSIR2* + FITC-labeled rabbit Ig anti-mouse IgG

6 times increase of *LmSIR2* protein synthesis

NAD⁺-dependant deacetylase activity in pSIR2 extracts

- [³H]-labeled histone peptide incubated with parasite extracts with or without NAD

Growth of axenic amastigotes which overexpress LmSIR2

Normal culture conditions (MAA20 : pH 5, 37°C)

Overexpression of LmSIR2 increased survival of stationary phase axenic amastigotes

L. infantum (LiSIR2) gene sequencing and functional characterization

Methodology :

- Screening of a genomic *L. infantum* (CLhyg) library using LmSIR2 labeled cDNA as a probe
- Isolation of a genomic *Hind* III fragment of 5.9kb and sequencing :
 - « LiSIR2 » (373aa) : 93% identity to LmSIR2
- Transfection of WT *L. infantum* promastigotes with either the empty cosmid (CLhyg) or the cosmid carrying the *LiSIR2* gene (CLSIR2)

Under normal culture conditions (MAA20 : pH 5, 37°C)

Reverse genetic approaches

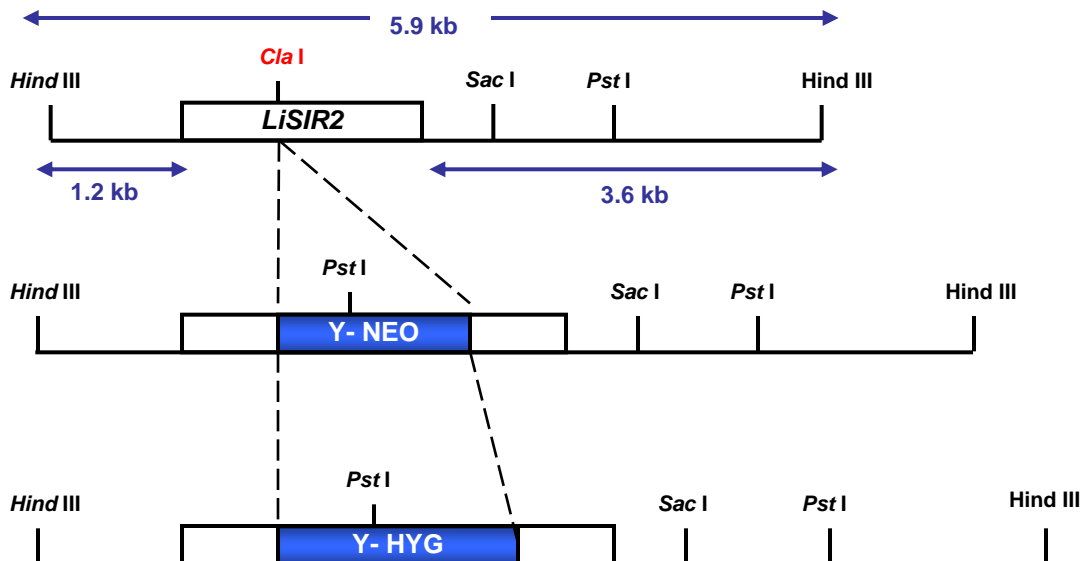

- Defined DNA construct carrying drug resistance gene (selection)
- Transfection
- Homologous recombination
- Mutant parasites
- Phenotype studies

LiSIR2 gene inactivation by homologous recombination « Knock out »

Leishmania : diploïd, mitosis : 2 steps for inactivation of both alleles

Methodology : gene disruption

- *Hind* III genomic fragment of 5.9 kb carrying the *LiSIR2* gene
- Y-NEO and Y-HYG integration into the *LiSIR2* catalytic domain (*Cla* I)
- Plasmid DNA construct was digested using *Hind* III for transfection purposes
- Drug selection and cloning of parasites

WT *LiSIR2* Locus

LiSIR2::neo Locus

LiSIR2::hyg Locus

- Production of single mutant parasites *LiSIR2*^{+/-}

- No possibility to get viable double mutants *LiSIR2*^{-/-} (neo/hyg or hyg/neo)

Inactivation of both *LiSIR2* alleles required episomal rescue

LiSIR2 : essential for parasite survival

Growth phenotype of *LiSIR2*^{+/-} *in vitro*

SIR2 inhibitors

➤ The presence of a common structural moiety (naphthalene) in some molecules identified as Sirtuin inhibitors led us to re-evaluate the activity of bisnaphthalimidopropyl (BNIP) derivatives toward the enzyme activity and the parasite growth

BNIP derivatives

L. infantum SIR2RP1 (LiSIR2RP1) and human SIRT1 (hSIRT1) inhibitory activity of BNIP derivatives

Compound	Name	Structure	IC ₅₀ ± SD (μM)		Selectivity index (IC ₅₀ LiSIR2RP1/hSIRT1)
			LiSIR2RP1	hSIRT1	
1	BNIPDabut		35.0 ± 5.8	73.1 ± 14.9	2.1*
2	BNIPDapen		37.7 ± 6.9	82.2 ± 16.4	2.2*
3	BNIPDahez		43.3 ± 9.5	93.5 ± 7.8	2.2**
4	BNIPDahep		52.7 ± 5.2	127.5 ± 31.9	2.4*
5	BNIPDaoct		9.2 ± 1.4	116.5 ± 23.3	12.7**
6	BNIPDanon		5.7 ± 0.2	97.4 ± 4.9	17.0***
7	BNIPDadec		11.2 ± 1.6	113.8 ± 22.7	10.2**
8	BNIPDadodec		10.1 ± 1.2	94.7 ± 23.7	9.4**
9	BNIPSpd		17.9 ± 1.6	94.8 ± 23.7	5.3**
10	BNIPSpm		39.5 ± 6.5	102.2 ± 31.9	2.6**
11	BNIPDpta		32.8 ± 2.4	43.1 ± 9.3	1.3
12	BNIPDeta		54.7 ± 15.7	182.8 ± 22.2	3.3**

IC₅₀ ± SD data are reported as the mean of at least three independent experiments.

*, $p < 0.05$; **, $p < 0.01$; and ***, $p < 0.001$ between the LiSIR2RP1 and the hSIRT1

The most active and selective inhibitor (parasite versus human enzyme) was BNIPDanon. Based on kinetic studies, its inhibitory activity is due to competition with NAD⁺

Docking results of poly amines

A and C human hSIRT1, B and D LiSIR2RP1; A and B cavity depth, C and D electrostatic potential map of the protein molecule, NAD is yellow and other molecule is BNIPDanon.

BNIPDanon has six hydrogen bonding aas present in LiSIR2RP1 NAD binding cavity and docking score is -17.244.

BNIPDanon shows five hydrogen bonding with aas present in hSIRT1 NAD binding cavity and docking score is -15.889.

Other three molecules Dadodec, Dadec and Dadex are also docking in the same place with same pose in both the protein which basically validate the docking positions.

Effect of BNIP derivatives on the intracellular development of *L. infantum* amastigotes

	Compound	Intracellular Amastigotes
1	BNIPDabut	4.53±0.54
2	BNIPDapen	1.26±0.18
3	BNIPDahez	3.46±0.48
4	BNIPDahep	1.12±0.0084
5	BNIPDaoct	2.43±0.19

7	BNIPDadec	1.02±0.41
8	BNIPDadodec	1.01±0.39
9	BNIPDpta	4.22±1.07
10	BNIPDeta	9.52±0.56

PMA differentiated THP-1 cells infected with amastigotes were incubated with a serial range of each drug concentrations during three days. The growth inhibitory effect of the drugs was determined by the luciferase assay and the IC₅₀ calculated by linear regression analysis. Each experiment was performed in triplicate and the IC₅₀ values represented correspond to the mean value obtained for at least three independent experiments.

Values represent the mean ± standard deviation of the means of 3 to 4 mice per group. *, p<0.05; ***, p<0.001 between the drug treated group and the control group.

Summary

We believe that the investigations of parasite metabolic pathways may uncover new distinctive features and functional differences in target gene products that will be exploited for the design of selective means to interfere with their biological properties

Thank you
